

Appsforce - Home Assignment

The Users Library

The task is to write a simple user library app in **Angular**.

Data is provided via an Ajax Request - <https://randomuser.me/api/?results=10>.

Each Person will have:

1. Name - title, first name, last name.
2. Email.
3. User image - medium.
4. Location - country, city, street.
5. UUID/ID.

* All other fields are irrelevant.

The page will show all the users resolved from the requests with a proper design
- **nice design == high score!**

1. The design should be responsive.
2. Use styled components/scss modules, also you can use ui framework such as material-ui/bootstrap etc.
3. Each user can edit (locally).
4. Edit button should open a modal with save and cancel button.
5. The fields that can edit are - Name, Email and Location.
6. Proper validation should be included:
 - All Fields cannot be empty.
 - **Name** - min of 3 characters.
 - **Email** - should be a valid email address.
 - Each user should have a unique email address
7. Proper error message should be shown when trying to save a user - don't use HTML5 validation.
8. Implement "**Add user**" button. Should open a new user form.
9. Each user can be deleted (show confirm message before deleting).

Bonus Task:

1. Use Redux or any other state management tool (high bonus).
2. Use Typescript (high bonus).
3. Add a search filter by email, name, id and location (client side search).

Important notes:

1. Make a clean(!) code.
2. Separate your code into files.
3. The app should look nice.
4. Use advanced features of angular.
5. **Do not repeat yourself.**

How to submit the code:

1. Upload the code to your Github or other VCS.
2. Upload the app to server Heroku/Firebase/Aws.
3. Send us the repository link + link to a working task.

Good Luck!
